Knee Disarticulation Custom Sockets

The Symes custom socket is a VCSPS™ type socket with some unique features: there is a distal strap which will provide AP, ML and circumferential control and reduction (not unlike the VCSPS™), the socket has two unique slot sets, one is located, medially and laterally, on the posterior section at the distal belly of the calf, and the other is located medially and laterally, on the posterior section at the smallest portion of the ankle.

This configuration allows for a variety of shapes and sizes to be comfortably covered by the socket. Most patients use the Symes socket for transfers, but early and extended ambulation becomes possible with the addition of the Symes UFOS™.

At ***FLO-TECH®*** Custom sockets and systems are shipped on the same day as ordered (if order is received prior to Noon Eastern Standard Time.) We also have components for all systems.
